IR protocol analyzer v1.1

(c) 2010 Ondrej Stanek, ostan89@gmail.com

www.ostan.cz

IR protocol analyzer is a universal application for automatic decoding dozens types of infrared remote control protocol packets. The application uses microphone input of a soundcard to capture infrared signal form a remote control. As a consequence, the hardware receiver is minimalistic and easy to build; just plug a phototransistor to input of your soundcard, that's all hardware you need. See user's manual for more information.
