Armmite H7
User
Manual

MMBasic Ver 5.04.30

The Armmite H7 is a new addition to the Micromite family using the STM32H7. The Armmite H7 firmware implements most of the features of the standard Micromite and the Micromite Plus as described in the *Micromite User Manual* and the *Micromite Plus Manual*. It has a number of differences and additional features and they are described in this document.
The focus of this manual is to describe just the features that are **unique** to the Armmite H7. For general Micromite programming you should refer to the *Micromite User Manual* and the *Micromite Plus Manual* in addition to this manual.

Contents

Introduction

This manual provides an introduction for users who are familiar with the Micromite and the Micromite Plus and need a summary of the extra features in the Armmite H7.

The Armmite H7 is an extension of the standard Micromite and the Micromite Plus; most of the features of these two versions are also in the Armmite H7. This includes features of the BASIC language, input/output, communications, etc. Some commands have changed slightly but for the main part Micromite programs will run unchanged on the Armmite H7.

The following summarises features of the Armmite H7 as compared to the standard Micromite and the Micromite Plus:

The Armmite H7 is based on the STM32H743ZI. It has up to fifteen times the program space of the MX series used in the standard Micromite and is many times faster. The Armmite H7 is roughly 2x faster than even a 252MHz PIC32MZ.

The Armmite H7 uses the built in hardware floating point capability of the STM32H743ZI processor which is much faster than floating point on the standard Micromite and uses double precision floating point.

The Armmite H7 has 96 free I/O pins. The Armmite H7 supports 25 16-bit analogue inputs.

The Armmite H7 has two I^{2}C ports, four SPI ports, eight high speed PWM channels , two 12-bit DACs, a high speed counter input, and four serial COM ports.

The STM32H73ZI is conveniently available package on a development PCB the NUCLEO-H743ZI . This is widely available through the normal suppliers (RS, Farnell, Mouser, etc.) at low cost.

Micromite Family Summary

The Micromite Family consists of five major types, the standard Micromite, the Micromite Plus, the Micromite eXtreme, the Pi-cromite and the Armmite H7. All use the same BASIC interpreter and have the same basic capabilities however they differ in the number of I/O pins, the amount of memory, the displays that they support and their intended use.

Standard Micromite	Comes in a 28-pin or 44-pin package and is designed for small embedded controller applications and supports small LCD display panels. The 28-pin version is particularly easy to use as it is easy to solder and can be plugged into a standard 28-pin IC socket.
Micromite Plus	This uses a 64-pin and 100-pin TQFP surface mount package and supports a wide range of touch sensitive LCD display panels from 1.44" to 8" in addition to the standard features of the Micromite. It is intended as a sophisticated controller with easy to create on-screen controls such as buttons, switches, etc.
Micromite eXtreme	This comes in 64, 100-pin and 144-pin TQFP surface mount packages. The eXtreme version has all the features of the other two Micromites but is faster and has a larger memory capacity plus the ability to drive a VGA monitor for a large screen display. It works as a powerful, self contained computer with its own BASIC interpreter and instant start-up.
Pi-cromite	Runs on all versions of the Raspberry Pi with a 40-pin I/O connector. No analogue input capability but 5x faster than a Micromite eXtreme when running on a Pi 3.
Armmite H7	Runs on the NUCLEO-H743ZI processor. This is the highest speed single-chip Micromite currently available.

Hardware considerations

The microcontroller used in the Armmite H7 is the STM32H743ZI manufactured by ST.

The default clock speed of the Armmite H7 is 400 MHz. The clock input to the chip must be an 8MHz external oscillator on pin 23.

The supported chips are:

STM32H743ZI	144-pin LQFP package (0.5 mm pin pitch) – maximum speed 400 MHz
STM32H753ZI	144-pin LQFP package (0.5 mm pin pitch) – maximum speed 400 MHz

144-pin Test and Development Board

The Nucleo-H743ZI is a complete module and breaks out all the pins on the chip. It includes a ST-LINK programmer for uploading the Armmite firmware and also provides a console connection via a USB CDC connection. It can be used standalone, or can be mounted directly onto a back pack PCB which provides connections to various LCD panels. Gerbers for the backpack are available on

http://www.thebackshed.com/forum/forum_posts.asp?TID=10700&PN=1

The power selector (JP3) on the Nucleo should be selected to E5V to use the daughter board

It is recommended that the following links on the Nucleo are removed:
JP4, SB13, SB160, JP6, SB127, SB125, SB164, SB178, SB181, JP7, SB183, SB182

In addition you must remove SB156 if using an external battery connected to VBAT

Please download and install ST-LINK and use it to program the Nucleo rather than STM32CubeProgrammer.It takes a little longer but it correctly programs the chip. My uploads are all done through the development environment which uses ST-LINK. I've just tested the most recent posted binary with both STM32CubeProgrammer and ST-LINK and it only works properly with when programmed with ST-LINK.

SDcard, SPI LCD and Touch Connections

The connections required to use an LCD panel are as follows

T_DO, SDO(MISO), SD_DO	Pin-20 (PF8)
T_DIN, SDI(MOSI), SD_DIN	Pin-21 (PF9)
T_CLK, SCK, SD_CLK	Pin-19 (PF7)
SD_CS	configurable
SD_CD	configurable
T_IRQ	configurable
T_CS	configurable

SSD1963, 16-bit ILI9341 Connections

Touch and SDcard connections as above

DB0	Pin-141 (PE0)	DB8	Pin-59 (PE8)	WR	Pin-125 (PG10)
DB1	Pin-141 (PE1)	DB9	Pin-60 (PE9)	RS	Pin-57 (PG11)
DB2	Pin-1 (PE2)	DB10	Pin-64 (PE10)	RESET	Pin-127 (PG12)
DB3	Pin-2 (PE3)	DB11	Pin-64 (PE11)	RD	Pin-128 (PG13) *

DB4	Pin-3 (PE4)	DB12	Pin-65 (PE12)	CS	GND
DB5	Pin-4 (PE5)	DB13	Pin-66 (PE13)		
DB6	Pin-5 (PE6)	DB14	Pin-67 (PE14)		
DB7	Pin-58 (PE7)	DB15	Pin-68 (PE15)		

SSD1963 displays should be configured for backlight control using 1963_PWM. Controlling the backlight using an Armmite H7 pin like the MM+ is not supported.

- Mandatory connection

OV7670 Camera connections

SIOC	Pin-139 (PB8)	SIOD	Pin-140 (PB9)

144	VDD		

Armmite H7 Features

400MHz clock
The Armmite H7 is the fastest single chip implementation of MMBasic

512Kbyte program and 498Kbyte variable space
The Armmite H7 supports MMBasic programs up to 512Kbytes in size. By default the maximum program size is set to 128Kb to expedite loading and saving programs but this can be extended as required with the **OPTION FLASHPAGES** command. Variable space is always 498Kbyte.

Dual 12-bit DACs
The Armmite H7 has 2 12-bit DACs built into the chip. The analogue levels can be set using the DAC command. In addition they are used for the PLAY TONE, PLAY WAV, PLAY FLAC and TTS commands. The pins cannot be used for general purpose I/O.

Double Precision Floating Point
The Armmite H7 uses the hardware floating point capability of the STM32H743ZI chip and can therefore process floating point calculations faster than the Micromite and Micromite Plus. All floating point uses double precision calculations.

Eight PWM Channels
Minimum frequency is 1Hz, maximum is 20MHz. Duty cycle and frequency accuracy will depend on frequency. The frequency can be any value of 200,000,000/n.

Three SPI Channels
The Armmite H7 supports three SPI channels. The second and third channels operate the same as the first, the only difference is that the commands use the notation SPI2 and SPI3 (for example SPI3 WRITE, etc).

Note that if the Armmite H7 is configured for a SPI based LCD panel, touch or an SD card then an additional SPI channel is used and does not impact the other three.

MM.DEVICE$
On the Armmite H7 the read only variable MM.DEVICE$ will return " Armmite ".

Longstring handling
The Armmite H7 supports a comprehensive set of commands and functions for handling long strings stored in integer arrays

I2C
You can use I2C exactly the same as the Micromite with the following limitations:
The implementation does not support 10-bit addressing (i.e. options 0 and 1 only).
The implementation does not support I2C slave mode

A second I2C channel can be used using the command **I2C2**.

I2C ports are dedicated and cannot be used for general purpose I/O

On-chip RTC supporting DATE$ and TIME$
Date$ and Time$ are derived from the STM32H743ZI on-chip real time clock. They are returned in standard MMBasic format when read. Setting them will update the real time clock. If a 3V battery is connected the STM32H743ZI will maintain the time even when powered off. An addition MMBasic function **DAY$** returns the day of the week as a string.

VAR command
The Armmite H7 allows up to 128Kbs of variables to be saved

Resetting the chip and options
The chip can be reset to "just-programmed" state by connecting pin 7 to VDD whilst resetting the chip by grounding the RESET pin.

16-bit ADCs
All analogue to digital conversion is carried out in 16-bit resolution. In addition the ADC can read the voltage being output on the DACs, the battery backup voltage, the chip die temperature and the internal reference voltage.

USB Keyboard support
The Armmite H7 supports a USB keyboard in US or UK format. This is enabled with the **OPTION USBKEYBOARD** command. A keyboard can be plugged directly into the micro-USB port of a Nucleo-H743ZI using a suitable adapter.

Buffered Drivers for all displays
All displays up to and including 480x320 pixel resolution automatically use a buffered driver where a memory image of the display is maintained in the Armmite's memory. This does not impact user RAM space but helps reduce artefacts whilst writing to the screen. Commands **OPTION AUTOREFRESH** and **REFRESH** can be used to control when the updates to the screen take place allowing the programmer maximum flexibility in using the screen effectively. A buffered driver is also included for 800x480 displays but this reduces user RAM significantly (down to 98Kbytes free).

16-bit Interface to SSD1963 Based LCD Displays
The Armmite H7 can drive a SSD1963 display using a 16-bit parallel bus for extra speed. The extra I/O pins for this are listed as SSD1963-DB8 to SSD1963-DB15 on the pinout tables in this manual and they must be connected to the pins labelled DB8 to DB15 on the I/O connector on the SSD1963 display.

Note that in this mode the SSD1963 controller runs with a reduce colour range (65 thousand colours) compared to 16 million colours with the normal 8-bit interface.

WS2812 support
The Armmite H7 supports the WS2812 Led driver. This chip needs very specific timing to work properly and by incorporating support in the Armmite H7 firmware the user can program these chips with minimum effort. The command **WS2812** is used to set the colours of the LEDs. There is no limit to the size of the WS2812 string supported.

GPS support
The Armmite H7 support connection of a GPS to any of the 4 serial interfaces. The command **OPEN "COMn:baudrate" as GPS** is used to enable reception of NMEA GPS messages. THE **GPS()** function can then be used to interrogate the GPS data which is automatically parsed in the Armmite firmware. In addition **PRINT #GPS,string$** can be used to automatically append a correct checksum to a GPS message.

High speed frequency counter support
The Armmite H7 supports a frequency counter input to pin 93. This supports counting high speed signals (tested to 20MHz, but may go considerably higher).

OV7670 camera support with movement detection

The Armmite H7 supports a non-buffered OV7670 camera in full colour 640x480 pixel mode using the **CAMERA** command. To use this a 800x480 SSD1963 display must be connected and configured using a special driver (**OPTION LCDPANEL SSD1963_5_640, orientation** or **OPTION LCDPANEL SSD1963_7_640, orientation**) in landscape or reverse landscape mode. The driver maintains a complete image in Armmite memory which allows the software to compare a newly captured image with a stored one to check for movement using the **MOVEMENT()** function.

Sprites

The Armmite H7 supports a complete implementation of sprites including screen scrolling and collision detection

Extended WAV File Playback

The Armmite H7 can play WAV files (like the Micromite Plus) however, it is also capable of playing WAV files recorded with sampling rates of 24 KHz, 44.1KHz, and 48 KHz.

Random Number Generation

The Armmite H7 uses the hardware random number generator in the STM32 series of chips to deliver true random numbers. This means that the RANDOMIZE command is no longer needed and is not supported.

OPTION VCC command

The Armmite H7 supports the OPTION VCC command. This allows the user to precisely set the supply voltage to the chip and is used in the calculation of voltages when using analogue inputs e.g. OPTION VCC 3.15. The parameter is not saved and should be initialised either on the command line or in a program.

CFunctions

CFunctions are supported and work correctly. However, currently there is no specified mechanism for compiling CFunctions and converting the compiled code to MMBasic statements.

Unsupported commands

The Armmite H7 does not currently support dynamically changing the CPU speed or the sleep function. Accordingly the commands CPU speed and CPU SLEEP are not available.
The ArmmiteH7 does not currently support the watchdog command and functionality.
The Armmite H7 does not support the LIBRARY command but given the large program space available this should not create any issues.

Commands (Armmite H7 Only)

BOX x1, y1, w, h [, lw] [,c] [,fill]	All parameters can now be expressed as arrays and the software will plot the number of boxes as determined by the dimensions of the smallest array. x1, y1, w, and h must all be arrays or all be single variables /constants otherwise an error will be generated. lw, c, and fill can be either arrays or single variables/constants. See the Micromite User manual for full details of parameter usage.
BLIT ……	The BLIT and SPRITE commands can be used interchangeably. All Micromite Plus functionality is preserved with minor functional changes. See the SPRITE command for functionality over and above the Micromite Plus and command differences.
CAMERA OPEN	Initialises an OV7670 camera ready for use
CAMERA CAPTURE	Captures an image from the camera to a connected 800x480 SSD1963 display. NB: the display must be set to 640 pixel mode using the OPTION LCDPANEL command
CAMERA SAVE "filename"	saves the on-screen image to the SDcard. If the file extension is not specified then ".BMP" is appended.
CAMERA REGISTER register, value	can be used to change the camera settings see the datasheet for details
CAMERA CLOSE	disables the camera and frees the allocated pins
CIRCLE x, y, r [,lw] [, a] [, c] [, fill]	All parameters can now be expressed as arrays and the software will plot the number of boxes as determined by the dimensions of the smallest array. x, y and r must all be arrays or all be single variables /constants otherwise an error will be generated. lw, a, c, and fill can be either arrays or single variables/constants. See the Micromite User manual for full details of parameter usage.
CLOSE [#]nbr [,[#]nbr]	The text "GPS" can be substituted for [#]nbr to close a communications port used for a GPS receiver
DAC n, voltage	Sets the DAC channel (1 or 2) to the voltage requested. This command cannot be used if the DACs are in use for audio output.
GUI STARTLINE n	Sets the row in the graphics memory which will appear at the top of the screen (landscape or reverse landscape) or left of the screen (portrait or reverse portrait) for a 4.3" SSD1963 display initialised with OPTION LCDPANEL SSD1963_4P [_16]

I2C2 OPEN speed, timeout [, PU I2C2 WRITE addr, option, sendlen, senddata [,sendata ....] I2C2 READ addr, option, rcvlen, rcvbuf I2C2 CLOSE I2C2 SLAVE OPEN addr, mask, option, send_int, rcv_int I2C2 SLAVE WRITE sendlen, senddata [,sendata ....] I2C2 SLAVE READ rcvlen, rcvbuf, rcvd I2C2 SLAVE CLOSE	See Appendix B of the Micromite User Manual.
LINE x1, y1, x2, y2 [, LW [, C]]	All parameters can now be expressed as arrays and the software will plot the number of boxes as determined by the dimensions of the smallest array. x1, y1, x2, and y2 must all be arrays or all be single variables /constants otherwise an error will be generated. lw and c can be either arrays or single variables/constants. See the Micromite User manual for full details of parameter usage.
LOAD SPRITE [#]n, fname$	Alternate form. See SPRITE LOAD
LONGSTRING APPEND array%(), string$	Append a normal MMBasic string to a long string variable. array%() is a long string variable while string$ is a normal MMBasic string expression.
LONGSTRING CLEAR array%()	Will clear the long string variable array%(). ie, it will be set to an empty string.
LONGSTRING COPY dest%(), src%()	Copy one long string to another. dest%() is the destination variable and src%() is the source variable. Whatever was in dest%() will be overwritten.
LONGSTRING CONCAT dest%(), src%()	Concatenate one long string to another. dest%() is the destination variable and src%() is the source variable. src%() will the added to the end of dest%() (the destination will not be overwritten).
LONGSTRING LCASE array%()	Will convert any uppercase characters in array%() to lowercase. array%() must be long string variable.

LONGSTRING LEFT dest%(), src%(), nbr	Will copy the left hand 'nbr' characters from src%() to dest%() overwriting whatever was in dest%(). ie, copy from the beginning of src%(). src%() and dest%() must be long string variables. 'nbr' must be an integer constant or expression.
LONGSTRING LOAD array%(), nbr, string$	Will copy 'nbr' characters from string$ to the long string variable array%() overwriting whatever was in array%().
LONGSTRING MID dest%(), src%(), start, nbr	Will copy 'nbr' characters from src%() to dest%() starting at character position 'start' overwriting whatever was in dest%(). ie, copy from the middle of src%(). 'nbr' is optional and if omitted the characters from 'start' to the end of the string will be copied src%() and dest%() must be long string variables. 'start' and 'nbr' must be an integer constants or expressions.
LONGSTRING PRINT [#n,] src%()	Prints the longstring stored in src%()
LONGSTRING REPLACE array%() , string$, start	Will substitute characters in the normal MMBasic string string$ into an existing long string array%() starting at position 'start' in the long string.
LONGSTRING RIGHT dest%(), src%(), nbr	Will copy the right hand 'nbr' characters from src%() to dest%() overwriting whatever was in dest%(). ie, copy from the end of src%(). src%() and dest%() must be long string variables. 'nbr' must be an integer constant or expression.
LONGSTRING TRIM array%(), nbr	Will trim 'nbr' characters from the left of a long string. array%() must be a long string variables. 'nbr' must be an integer constant or expression.
LONGSTRING UCASE array%()	Will convert any lowercase characters in array%() to uppercase. array%() must be long string variable.
OPEN comspec$ AS GPS [,timezone_offset] [,monitor]	Will open a serial communications port for reading from a GPS receiver. See the GPS function for details. The timezone_offset parameter is used to convert UTC as received from the GPS to the local timezone. If omitted the timezone will default to UTC. The timezone_offset can be a any number between -12 and 14 allowing the time to be set correctly even for the Chatham Islands in New Zealand (UTC +12:45). If the monitor parameter is set to 1 then all GPS input is directed to the console. This can be stopped by closing the GPS channel.
OPTION AUTOREFRESH mode	When using buffered driver TFT drivers this command controls when screen updates take place. When autorefresh is "ON" updates take place immediately. When autorefresh is "OFF" updates take place in the framebuffer and are only written to the screen when autorefresh is next turned "ON" or the REFRESH command is issued.

OPTION FLASHPAGES n	Sets the number of 128Kbyte pages to be used for storing programs. Valid values are 1 (default) to 4. Increasing the number of pages increases time to store programs and execute "NEW" commands.
OPTION LCDPANEL ILI9341_16, orientation	Selects 16-bit bus operation of the ILI9341 display. Pin usage is exactly as per the SSD1963. Uses a memory resident framebuffer to improve performance.
OPTION LCDPANEL ILI9841, orientation, DCpin, RESETpin, CSpin	Initialises a TFT display using the ILI9841 controller. This supports 480 * 320 resolution. See the Micromite User manual, ILI9341 section, for full details of parameter usage.
OPTION LCDPANEL SSD1963_n_16, orientation	Selects 16-bit bus operation of the various SSD1963 displays. See the Micromite plus manual for full details of syntax.
OPTION LCDPANEL SSD1963_n_BUFF, orientation	Selects 16-bit bus operation of the 5" and 7" SSD1963 displays using a memory framebuffer for improved performance. This uses 400K of memory leaving 98K for user programs
OPTION LCDPANEL SSD1963_n_640, orientation	Selects 16-bit bus operation of the 5" and 7" SSD1963 displays with a usable display width of 640 pixels using a memory framebuffer for improved performance. This uses 250K of memory leaving 248K for user programs. This driver must be selected in order to use the CAMERA commands. It can also be used effectively for game programming using the SPRITE commands and functions
OPTION SERIAL PULLUP DISABLE OPTION SERIAL PULLUP ENABLE	permanently stored option that disables pullups on all serial ports default: permanently stored option that enables pullups on all serial ports
OPTION USBKEYBOARD layout	Sets the key layout for a connected USB keyboard. Valid layouts are UK and US
OPTION VCC voltage	This allows the user to precisely set the supply voltage to the chip and is used in the calculation of voltages when using analogue inputs. The parameter is not saved and should be initialised either on the command line or in a program.
PIXEL x, y [,c]	All parameters can now be expressed as arrays and the software will plot the number of boxes as determined by the dimensions of the smallest array. x and y must both be arrays or both be single variables /constants otherwise an error will be generated. c can be either an arrays or single variable/constant. See the Micromite User manual for full details of parameter usage.

PLAY FLAC file$ [, interrupt]	Will play a FLAC file on the DAC outputs. Supported frequencies are: 44100Hz 16-bit(CD quality) and 24-bit 48000Hz 16-bit and 24-bit 88200Hz 16-bit and 24-bit 96000Hz 24-bit 192000Hz 24-bit 'file$' is the FLAC file to play (the extension of .flac will be appended if missing). The FLAC file is played in the background. 'interrupt' is optional and is the name of a subroutine which will be called when the file has finished playing.
PRINT #GPS, string$	Outputs a NMEA string to an opened GPS device. The string must start with a $ character and end with a * character. The Checksum is calculated automatically by the firmware and is appended to the string together with cr,lf
PWM 1, freq, 1A [,1B] [,1C], [1D] PWM 2, freq, 2A [,2B] [,2C], [2D]	See description of the PWM command in the Micromite User Manual. This command allows the specification of a frequency for extra PWM channels
REFRESH	Flushes the entire memory buffer of the display to the screen. This command can be used with OPTION AUTOREFRESH OFF to control when the screen is updated
RBOX x1, y1, w, h [, r] [,c] [,fill]	All parameters can now be expressed as arrays and the software will plot the number of boxes as determined by the dimensions of the smallest array. x1, y1, w, and h must all be arrays or all be single variables /constants otherwise an error will be generated. r, c, and fill can be either arrays or single variables/constants. See the Micromite User manual for full details of parameter usage.
SETPIN 93, CIN SETPIN 93 ,FIN	This enables a high speed frequency counter (tested to 20MHz) Period measurement (SETPIN 93, PIN) is not supported on this pin
SPRITE	The BLIT and SPRITE commands can be used interchangeably
SPRITE x1, y1, x2, y2, w, h	Copies the memory area specified by top right coordinate x1, y1 and of width w and height h to a new location where the top right coordinate is x2, y2.
SPRITE CLOSE [#]n	Closes sprite n and releases all memory resources. Updates the screen (see SPRITE HIDE). Sprites which have been "copied" cannot be closed until all "copies" have been closed
SPRITE CLOSE ALL	Closes all sprites and releases all memory resources. It does not change the screen.

SPRITE COPY [#]n, [#]m, nbr	Makes a copy of sprite "n" to "nbr" of new sprites starting a number "m". Copied sprites share the same loaded image as the original to save memory
SPRITE HIDE [#]n	Removes sprite n from the display and replaces the stored background. To restore a screen to a previous state sprites should be hidden in the opposite order to which they were written "LIFO"
SPRITE INTERRUPT sub	Specifies the name of the subroutine that will be called when a sprite collision occurs. See Appendix C for how to use the function SPRITE to interrogate details of what has collided
SPRITE LOAD [#]n, fname$ [,colour]	Loads the file fname$ as a sprite into buffer number n. The file must be in PNG format RGB888 or RGBA888. If the file extension .PNG is omitted then it will be automatically added. The parameter "colour" specifies the background colour for the sprite. Pixels in the background colour will not overwrite the background when the sprite is displayed. Colour defaults to zero
SPRITE MOVE	Actions a single atomic transaction that re-locates all sprites which have previously had a location change set up using the SPRITE NEXT command. Collisions are detected once all sprites are moved and reported in the same way as from a scroll
SPRITE NEXT [#]n, x, y	Sets the X and Y coordinate of the sprite to be used when the screen is next scrolled or the SPRITE MOVE command is executed. Using SPRITE NEXT rather than SPRITE SHOW allows multiple sprites to be moved as part of the same atomic transaction.
SPRITE NOINTERRUPT	Disables collision interrupts
SPRITE READ [#]n, x , y, w, h	Reads the display area specified by coordinates x and y, width w and height h into buffer number n. If the buffer is already in use and the width and height of the new area are the same as the original then the new command will overwrite the stored area.
SPRITE SCROLLH n [,col]	Scrolls the background and any sprites on layer 0 n pixels to the right. n can be any number between -31 and 31. Sprites on any layer other than zero will remain fixed in position on the screen. By default the scroll wraps the image round. If "col" is specified the colour will replace the area behind the scrolled image
SPRITE SCROLLR x, y, w, h, delta_x, delta_y [,col]	Scrolls the region of the screen defined by top-right coordinates "x" and "y" and width and height "w" and "h" by "delta_x" pixels to the right and "delta_y" pixels up. By default

	the scroll wraps the background image round. If "col" is specified the colour will replace the area behind the scrolled image. Sprites on any layer other than zero will remain fixed in position on the screen. Sprites in layer zero where the centre of the sprite (x+ w/2, y+ h/2) falls within the scrolled region will move with the scroll and wrap round if the centre moves outside one of the boundaries of the scrolled region.
SPRITE SCROLLV n [,col]	Scrolls the background, and any sprites on layer 0, n pixels up. n can be any number between -MM.VRES-1 and MM.VRES-1. Sprites on any layer other than zero will remain fixed in position on the screen. . By default the scroll wraps the image round. If "col" is specified the colour will replace the area behind the scrolled image
SPRITE SHOW [#]n, x, layer, [orientation]	Displays sprite n on the screen with the top left at coordinates x, y. Sprites will only collide with other sprites on the same layer, layer zero, or with the screen edge. If a sprite is already displayed on the screen then the SPRITE SHOW command acts to move the sprite to the new location. The display background is stored as part of the command such that it can be replaced when the sprite is hidden or moved further. The orientation is an optional parameter, valid values are: 0 - normal display (default if omitted) 1 - mirrored left to right 2 - mirrored top to bottom 3 - rotated 180 degrees (= 1+2)
SPRITE WRITE [#]n, x y	Overwrites the display with the contents of sprite buffer n with the top left at coordinates x, y. SPRITE WRITE overwrites the complete area of the display. The background that is overwritten is not stored so SPRITE WRITE is inherently higher performing than SPRITE SHOW but with greater functional limitations.
SERVO 1 [, freq], 1A [,1B] [,1C] [,1D] SERVO 2 [, freq], 2A [,2B] [,2C] [,2D]	See description of the SERVO command in the Micromite User Manual. This command allows the specification of a frequency for extra channels
SENSORFUSION type ax, ay, az, gx, gy, gz, mx, my, mz, pitch, roll, yaw [,p1] [,p2]	Calculates pitch, roll and yaw angles from accelerometer and magnetometer inputs. Valid fusion types are MAHONY and MADGWICK. Usage is described in Appendix A

SPI3 OPEN speed, mode, bits SPI READ nbr, array() SPI WRITE nbr, data1, data2, data3, … etc or SPI WRITE nbr, string$ or SPI WRITE nbr, array() SPI CLOSE	See Appendix D of the Micromite User Manual.
TRIANGLE X1, Y1, X2, Y2, X3, Y3 [, C [, FILL]]	All parameters can now be expressed as arrays and the software will plot the number of boxes as determined by the dimensions of the smallest array. x1, y1, x2, y2, x3,and y3 must all be arrays or all be single variables /constants otherwise an error will be generated c and fill can be either arrays or single variables/constants. See the Micromite Plus manual for full details of parameter usage.
TTS [PHONETIC] "text" [,speed] [,pitch] [,mouth] [,throat] [, interrupt]	Outputs text as speech on the DAC outputs. See http://www.retrobits.net/atari/sam.shtml for details of parameter usage. The speech is played in the background. 'interrupt' is optional and is the name of a subroutine which will be called when the speech has finished playing.

WS2812 pinno, colours%()	This command outputs the required signals needed to drive WS2812 LED drivers on the pin specified. The colours%() array should be sized to have exactly the same number of elements as the number of LEDs to be driven. Each element in the array should contain the colour in the normal RGB888 format (0 - &HFFFFF) e.g.
	`dim b%(6)=(rgb(red), rgb(green), rgb(blue), rgb(Yellow), rgb(cyan), rgb(magenta), rgb(white))`
	`setpin 1,dout`
	`ws2812 1,b%()`
	will output the specified colours to an array of 7 WS2812 LEDs

Functions (Armmite H7 Only)

DAY$	Returns the day of the week as a string "Monday", "Tuesday" etc.
GPS(ALTITUDE)	returns current altitude if sentence GGA enabled
GPS(DATE)	returns the normal date string corrected for local time e.g. "12-01-2017"
GPS(DOP)	returns DOP (dilution of precision) value if sentence GGA enabled
GPS(FIX)	returns 0=no fix, 1=fix, etc. if sentence GGA enabled
GPS(GEOID)	Returns the geoid-ellipsoid separation. if sentence GGA enabled
GPS(LATITUDE)	returns the latitude in degrees as a floating point number, values are –ve for South of equator
GPS LONGITUDE)	returns the longitude in degrees as a floating point number, values are –ve for West of the meridian
GPS(SATELLITES)	returns number of satellites in view if sentence GGA enabled
GPS(SPEED)	returns the ground speed in knots as a floating point number
GPS(TIME)	returns the normal time string corrected for local time e.g. "12:09:33"
GPS(TRACK)	returns the track over the ground (degrees true) as a floating point number
GPS(VALID)	returns: 0=invalid data, 1=valid data. **ALWAYS CHECK THIS VALUE TO ENSURE DATA IS VALID BEFORE USING OTHER GPS() FUNCTION CALLS**
JSON$(array%(),string$)	Returns a string representing a specific item out of the JSON input stored in the longstring array%() e.g. JSON$(a%(), "name") JSON$(a%(), "coord.lat") JSON$(a%(), "weather[0].description") JSON$(a%(),"list[4].weather[0].description Examples taken from api.openweathermap.org

LCOMPARE(array1%(), array2%())	Compare the contents of two long string variables array1%() and array2%(). The returned is an integer and will be -1 if array1%() is less than array2%(). It will be zero if they are equal in length and content and +1 if array1%() is greater than array2%(). The comparison uses the ASCII character set and is case sensitive.
LGETSTR$(array%(), start, length)	Returns part of a long string stored in array%() as a normal MMBasic string. The parameters start and length define the part of the string to be returned.
LINSTR(array%(), search$ [,start])	Returns the position of a search string in a long string. The returned value is an integer and will be zero if the substring cannot be found. array%() is the string to be searched and must be a long string variable. Search$ is the substring to look for and it must be a normal MMBasic string or expression (not a long string). The search is case sensitive. Normally the search will start at the first character in 'str' but the optional third parameter allows the start position of the search to be specified.
LLEN(array%())	Returns the length of a long string stored in array%()
MM.DEVICE$	Returns "Armmite "
MOVEMENT(sensitivity)	This function combines capturing a new image from an OV7670 camera with a comparison with the currently displayed image. It returns the number of pixels that are different between the images. The sensitivity parameter controls whether or not a pixel is considered to be different. The algorithm works by converting each image to a 6-bit greyscale image. The sensitivity is then the difference between the pixels that will be counted as a change. The top 20 and bottom 20 rows are ignored in the comparison. This allows the user to use these for other display purposes without artificially triggering the movement detection.
OWSEARCH(pin, flag [,serial_number_mask])	Returns the onewire device serial number as an INTEGER. Flags are: 0 - Continue an existing search 1 - start a new search 4 - Continue an existing search for devices in the requested family 5 - start a new search for devices in the requested family (the MSB of the serial_number_mask) 8 - skip the current device family and return the next device 16 - verify that the device with the serial number in serial_number_mask is available
SPI3(n)	See Appendix D of the Micromite User Manual
SPRITE(…)	

SPRITE(C, [#]n)	Returns the number of currently active collisions for sprite n. If n=0 then returns the number of sprites that have a currently active collision following a SPRITE SCROLL command
SPRITE(C, [#]n, m)	Returns the number of the sprite which caused the "m"th collision of sprite n. If n=0 then returns the sprite number of "m"th sprite that has a currently active collision following a SPRITE SCROLL command
SPRITE(H,[#]n)	Returns the height of sprite n. This function is active whether or not the sprite is currently displayed (active).
SPRITE(L, [#]n)	Returns the layer number of active sprites number n
SPRITE(N)	Returns the number of displayed (active) sprites
SPRITE(N,n)	Returns the number of displayed (active) sprites on layer n
SPRITE(S)	Returns the number of the sprite which last caused a collision. NB if the number returned is Zero then the collision is the result of a SPRITE SCROLL command and the SPRITE(C…) function should be used to find how many and which sprites collided.
SPRITE(W, [#]n)	Returns the width of sprite n. This function is active whether or not the sprite is currently displayed (active).
SPRITE(X, [#]n)	Returns the X-coordinate of sprite n. This function is only active when the sprite is currently displayed (active). Returns 10000 otherwise.
SPRITE(Y, [#]n)	Returns the Y-coordinate of sprite n. This function is only active when the sprite is currently displayed (active). Returns 10000 otherwise

Appendix A
Sensor Fusion

The Armmite H7 supports the calculation of pitch, roll and yaw angles from accelerometer and magnetometer inputs.

For information on this technology see https://github.com/kriswiner/MPU-6050/wiki/Affordable-9-DoF-Sensor-Fusion

The SENSORFUSION command supports both the MADGWICK and MAHONY fusion algorithms. The format of the command is:

SENSORFUSION type ax, ay, az, gx, gy, gz, mx, my, mz, pitch, roll, yaw [,p1] [,p2]
Type can be MAHONY or MADGWICK
Ax, ay, and az are the accelerations in the three directions and should be specified in units of standard gravitational acceleration.
Gx, gy, and gz are the instantaneous values of rotational speed which should be specified in radians per second.
Mx, my, and mz are the magnetic fields in the three directions and should be specified in nano-Tesla (nT)

Care must be taken to ensure that the x, y and z components are consistent between the three inputs. So , for example, using the MPU-9250 the correct input will be ax, ay,az, gx, gy, gz, **my, mx, -mz** based on the reading from the sensor.

Pitch, roll and yaw should be floating point variables and will contain the outputs from the sensor fusion.

The SENSORFUSION routine will automatically measure the time between consecutive calls and will use this in its internal calculations.

The Madwick algorithm takes an optional parameter p1. This is used as beta in the calculation. It defaults to 0.5 if not specified

The Mahony algorithm takes two optional parameters p1, and p2. These are used as Kp and Ki in the calculation. If not specified these default to 10.0 and 0.0 respectively.

A fully worked example of using the code is given on the BackShed forum at

http://www.thebackshed.com/forum/forum_posts.asp?TID=9321&PN=1&TPN=1

Appendix B
Sprites

See the SPRITE commands and functions for syntax details.
The concept of the sprite implementation is as follows:

1. Sprites are full colour and of any size. The collision boundary is the enclosing rectangle.
2. Sprites are loaded to a specific number (1-50)
3. Sprites are displayed using the SPRITE SHOW command
4. For each SHOW command the user must select a "layer". This can be between 0 and 10.
5. Sprites collide with sprites on the same layer, layer 0, or the screen edge
6. Layer 0 is a special case and sprites on all other layers will collide with it
7. The SCROLL commands leave sprites on all layers except layer 0 unmoved
8. Layer 0 sprites scroll with the background and this can cause collisions
9. There is no practical limit on the number of collisions caused by SHOW or SCROLL commands
10. The sprite function allows the user to fully interrogate the details of a collision
11. A SHOW command will overwrite the details of any previous collisions for that sprite
12. A SCROLL command will overwrite details of previous collisions for ALL sprites
13. To restore a screen to a previous state sprites should be removed in the opposite order to which they were written "LIFO"

Because moving a sprite or, particularly, scrolling the background can cause multiple sprite collisions it is important to understand how they can be interrogated.

The best way to deal with a sprite collision is using the interrupt facility. A collision interrupt routine is set up using the SPRITE INTERRUPT command.

e.g. SPRITE INTERRUPT collision

The following is a pro-forma for identifying all collisions that have resulted from either a SPRITE SHOW command or a SCROLL command

```
'
' This routine demonstrates a complete interrogation of collisions
'
sub collision
  local integer i
' First use the SPRITE(S) function to see what caused the interrupt
  if sprite(S) <> 0 then 'collision of specific individual sprite
    'sprite(S) returns the sprite that moved to cause the collision
        print "Collision on sprite ",sprite(S)
        process_collision(sprite(S))
        print ""
'
  else '0 means collision of one or more sprites caused by background move
```

```
    ' SPRITE(C, 0) will tell us how many sprites had a collision
    print "Scroll caused a total of ",sprite(C,0)," sprites to have collisions"
    for i=1 to sprite(C,0)
         ' SPRITE(C, 0, i) will tell us the sprite number of the "I"th sprite
      print "Sprite ",sprite(C,0,i)
      process_collision(sprite(C,0,i))
    next i
    print ""
  endif
end sub
' get details of the specific collisions for a given sprite
sub process_collision(S as integer)
  local integer i ,j
  'sprite(C, #n) returns the number of current collisions for sprite n
  print "Total of ",sprite(C,S)," collisions"
   for i=1 to sprite(C,S)
         ' SPRITE(C, S, i) will tell us the sprite number of the "I"th sprite
    j=sprite(C,S,i)
    if j=100 then
      print "collision with left of screen"
    else if j=101 then
      print "collision with top of screen"
    else if j=102 then
      print "collision with right of screen"
    else if j=103 then
      print "collision with bottom of screen"
    else
      print "Collision with sprite ",sprite(C,S,i) 'sprite(C, #n, #m) returns details of the mth collision
    endif
  next i
end sub
```
